SICSA CyberNexus Workshop Series

Workshop on Cybersecurity and the Internet of Things

Abertay University

1st March 2018

Call for Participation

The Internet of Things (IoT) is emerging from the lab into the everyday world, but the sheer number of devices of which it is predicted to comprise mean that current approaches to cybersecurity are unlikely to scale. Aspects of privacy associated with the widespread deployment of sensor devices have yet to find solutions. These and other problems make this a fruitful field for cybersecurity and computer science researchers.

Considering design, technological, human and societal aspects of the IoT, this one-day workshop will examine the challenges, possible solutions and interesting research directions associated with the problem of securing the IoT.

The programme for the day will include invited speakers but the intention is that researchers within the SICSA community will showcase their current projects/interests. You are therefore invited to submit proposals for talks (in the form of one paragraph abstracts) to ian.ferguson@abertay.ac.uk by Friday 16th Feb.

Registration

Please register for the workshop through Eventbrite at:
